The longtable package*

David Carlisle † 2024-04-26

This file is maintained by the LATEX Project team. Bug reports can be opened (category tools) at https://latex-project.org/bugs.html.

Abstract

This package defines the longtable environment, a multi-page version of tabular.

List of Tables

1	An optional table caption (used in the list of tables)
2	A floating table
3	A difficult \multicolumn combination: pass 1
4	A difficult \multicolumn combination: pass 2
5	A difficult \multicolumn combination: pass 3
6	A difficult \multicolumn combination: pass 4
7	A summary of longtable commands

1 Introduction

longtable (env.) The longtable package defines a new environment, longtable, which has most of the features of the tabular environment, but produces tables which may be broken by TeX's standard page-breaking algorithm. It also shares some features with the table environment. In particular it uses the same counter, table, and has a similar \caption command. Also, the standard \listoftables command lists tables produced by either the table or longtable environments.

The following example uses most of the features of the longtable environment. An edited listing of the input for this example appears in Section 8.

Note: Various parts of the following table will **not** line up correctly until this document has been run through LATEX several times. This is a characteristic feature of this package, as described below.

Pago 1	
 age 1	

^{*}This file has version number v4.20, last revised 2024-04-26.

 $^{^{\}dagger}$ The new algorithm for aligning 'chunks' of a table used in version 4 of this package was devised, coded and documented by David Kastrup.

Table 1: A long table

<	This part appears at the top of the	table	:
<	First	SECOND	:
٠	longtable columns are specified	in the	
•	same way as in the tabular	environment.	:
•	@{*}r p{1in}@{*}	in this case.	:
:	Each row ends with a	\\ command.	:
:	The \\ command has an	optional	:
:	argument, just as in	the	
:	tabular	environment.	
	See the effect of \\[10pt]	?	
	Lots of lines	like this.	
	Lots of lines	like this.	
	Lots of lines	like this.	
	Lots of lines	like this.	
	Also \hline may be used,	as in tabular.	
	That was a \hline		
	That was \hline\hline		
	This is a \multicolumn{2}{ c	}	
	If a page break occurs at a \hline then	a line is drawn	
	at the bottom of one page and at the	top of the next.	
	The [t] [b] [c] argument of tabular	can not be used	
	The optional argument may be one of	[1] [r] [c]	
	to specify whether the table should be	adjusted	
	to the left, right	or centrally.

	Lots of lines Lots of lines	like this.	

Table 1: (continued)

* This part appears at the top of every or	ther page
* First	Second
*Some lines may take up a lot of space, like this:	This last
	column is a "p"
	column so this
	"row" of the
	table can take
	up several lines.
	Note however
	that TeX will
	never break a
	page within
	such a row.
	Page breaks
	only occur
	between rows of
	the table or at
	\hline
	commands.
* Lots of lines	like this.
* Lots of lines	like this.
* Lots of lines	like this.
* Lots of lines	like this.
* Lots of lines	like this.
Lots of filles	like this.
Lots of filles	like tills.
Lots of fines	like tills.
Lots of filles	like this ²
Lots of filles	like tills.
Lots of filles	like this.
These lines will	appear
* in place of the	usual foot
* at the end	of the table

2 Chunk Size

LTchunksize In order to TEX multi-page tables, it is necessary to break up the table into smaller chunks, so that TEX does not have to keep everything in memory at one time. By default longtable uses 20 rows per chunk, but this can be set by the user, with e.g., \setcounter{LTchunksize}{10}. These chunks do not affect page breaking, thus if you are using a TEX with a lot of memory, you can set LTchunksize to be several pages of the table. TEX will run faster with a large LTchunksize.

......Page 3.....

 $^{^{1}}$ This is a footnote.

²longtable takes special precautions, so that footnotes may also be used in 'p' columns.

 $^{^3{\}rm You~can~also~use~the~plain~TeX~syntax~\LTchunksize=10.}$

longtable.stv

A	tabular	environment
within	a floating	table

Table 2: A floating table

However, if necessary, longtable can work with LTchunksize set to 1, in which case the memory taken up is negligible. Note that if you use the commands for setting the table head or foot (see below), the LTchunksize must be at least as large as the number of rows in each of the head or foot sections.

This document specifies \setcounter{LTchunksize}{200}. If you look at the previous table, after the first run of IATEX you will see that various parts of the table do not line up. LATEX will also have printed a warning that the column widths had changed. longtable writes information onto the .aux file, so that it can line up the different chunks. Prior to version 4 of this package, this information was not used unless a \setlongtables command was issued, however, now the information is always used, via a new algorithm, and so \setlongtables is no longer needed. It is defined (but does nothing) for the benefit of old documents that use it.

$\mathbf{3}$ Captions and Headings

At the start of the table one may specify lines which are to appear at the top \endhead of every page (under the headline, but before the other lines of the table). The lines are entered as normal, but the last \\ command is replaced by a \endhead \endfirsthead command. If the first page should have a different heading, then this should be entered in the same way, and terminated with the \endfirsthead command. The LTchunksize should be at least as large as the number of rows in the heading. \endfoot There are also \endfoot and \endlastfoot commands which are used in the same \endlastfoot way (at the start of the table) to specify rows (or an \hline) to appear at the bottom of each page. In certain situations, you may want to place lines which logically belong in the table body at the end of the firsthead, or the beginning of

the lastfoot. This helps to control which lines appear on the first and last page of

\caption

The \caption{...} command is essentially equivalent to

\multicolumn{n}{c}{\parbox{\LTcapwidth}{...}} where n is the number of columns of the table. You may set the width of the caption with a command such as \setlength{\LTcapwidth}{2in} in the preamble of your document. The default is 4in. \caption also writes the information to produce an entry in the list of tables. As with the \caption command in the figure and table environments, an optional argument specifies the text to appear in the list of tables if this is different from the text to appear in the caption. Thus the caption for table 1 was specified as \caption[An optional table caption (used in the list of tables)]{A long table\label{long}}.

You may wish the caption on later pages to be different to that on the first page. In this case put the \caption command in the first heading, and put a subsidiary caption in a \caption[] command in the main heading. If the optional argument to \caption is empty, no entry is made in the list of tables. Alternatively, if

⁴Due to David Kastrup.Page 4.....

٦-	
	ongtable.sty

you do not want the table number to be printed each time, use the \caption* command.

The captions are set based on the code for the article class. If you have redefined the standard \@makecaption command to produce a different format for the captions, you may need to make similar changes to the longtable version, \LT@makecaption. See the code section for more details.

A more convenient method of customising captions is given by the caption(2) package, which provides commands for customising captions, and arranges that the captions in standard environments, and many environments provided by packages (including longtable) are modified in a compatible manner.

You may use the \label command so that you can cross reference longtables with \ref. Note, however, that the \label command should not be used in a heading that may appear more than once. Place it either in the firsthead, or in the body of the table. It should not be the first command in any entry.

4 Multicolumn entries

The \multicolumn command may be used in longtable in exactly the same way as for tabular. So you may want to skip this section, which is rather technical, however coping with \multicolumn is one of the main problems for an environment such as longtable. The main effect that a user will see is that certain combinations of \multicolumn entries will result in a document needing more runs of LATEX before the various 'chunks' of a table align.

The examples in this section are set with LTchunksize set to the minimum value of one, to demonstrate the effects when \multicolumn entries occur in different chunks.

Consider Table 3. In the second chunk, longtable sees the wide multicolumn entry. At this point it thinks that the first two columns are very narrow. All the width of the multicolumn entry is assumed to be in the third column. (This is a 'feature' of Tex's primitive \halign command.) longtable then passes the information that there is a wide third column to the later chunks, with the result that the first pass over the table is too wide.

If the 'saved row' from this first pass was re-inserted into the table on the next pass, the table would line up in two passes, but would be much two wide.

The solution to this problem used in Versions 1 and 2, was to use a \kill line. If a line is \killed, by using \kill rather than \\ at the end of the line, it is used in calculating column widths, but removed from the final table. Thus entering \killed copies of the last two rows before the wide multicolumn entry would mean that \halign 'saw' the wide entries in the first two columns, and so would not widen the third column by so much to make room for the multicolumn entry.

In Version 3, a new solution was introduced. If the saved row in the .aux file was not being used, longtable used a special 'draft' form of \multicolumn, this modified the definition, so the spanning entry was never considered to be wider than the columns it spanned. So after the first pass, the .aux file stored the widest normal entry for each column, no column was widened due to \spanned columns. By default longtable ignored the .aux file, and so each run of LATEX was considered a first pass. Once the \setlongtables declaration was given, the saved row in the .aux file, and the proper definition of \multicolumn were

multicolumn 1–2		3
wide 1	2	3

......Page 6.....

used. If any \multicolumn entry caused one of the columns to be widened, this information could not be passed back to earlier chunks, and so the table would not correctly line up until the third pass. This algorithm always converged in three passes as described above, but in examples such as the ones in Tables 3–6, the final widths were not optimal as the width of column 2, which is determined by a \multicolumn entry, was not known when the final width for column 3 was fixed, due to the fact that both \multicolumn commands were switched from 'draft' mode to 'normal' mode at the same time.

Version 4 alleviates the problem considerably. The first pass of the table will indeed have the third column much too wide. However, on the next pass longtable will notice the error and reduce the column width accordingly. If this has to propagate to chunks before the \multicolumn one, an additional pass will, of course, be needed. It is possible to construct tables where this rippling up of the correct widths takes several passes to 'converge' and produce a table with all chunks aligned. However in order to need many passes one needs to construct a table with many overlapping \multicolumn entries, all being wider than the natural widths of the columns they span, and all occurring in different chunks. In the typical case the algorithm will converge after three or four passes, and the benefits of not needing to edit the document before the final run to add \setlongtables, and the better choice of final column widths in the case of multiple \multicolumn entries will hopefully more than pay for the extra passes that may possibly be needed.

So Table 3 converges after 4 passes, as seen in Table 6.

You can still speed the convergence by introducing judicious \kill lines, if you happen to have constellations like the above.

If you object even to LATEX-ing a file twice, you should make the first line of every longtable a \kill line that contains the widest entry to be used in each column. All chunks will then line up on the first pass.

5 Adjustment

The optional argument of longtable controls the horizontal alignment of the table. The possible options are [c], [r] and [1], for centring, right and left adjustment, \LTleft respectively. Normally centring is the default, but this document specifies

\LTright \setlength\LTleft\parindent \setlength\LTright\fill

in the preamble, which means that the tables are set flush left, but indented by the usual paragraph indentation. Any lengths can be specified for these two parameters, but at least one of them should be a rubber length so that it fills up the width of the page, unless rubber lengths are added between the columns using the **\extracolsep** command. For instance

٦-	
	ongtable.sty

6 Changes

This section highlights the major changes since version 2. A more detailed change log may be produced at the end of the code listing if the ltxdoc.cfg file specifies

\AtBeginDocument{\RecordChanges} \AtEndDocument{\PrintChanges}

Changes made between versions 2 and 3.

- The mechanism for adding the head and foot of the table has been completely rewritten. With this new mechanism, longtable does not need to issue a \clearpage at the start of the table, and so the table may start half way down a page. Also the \endlastfoot command, which could not safely be implemented under the old scheme, has been added.
- longtable now issues an error if started in the scope of \twocolumn, or the multicols environment.
- The separate documentation file longtable.tex has been merged with the package file, longtable.dtx using Mittelbach's doc package.
- Support for footnotes has been added. Note however that \footnote will not work in the 'head' or 'foot' sections of the table. In order to put a footnote in those sections (e.g., inside a caption), use \footnotemark at that point, and \footnotetext anywhere in the table body that will fall on the same page.
- The treatment of \multicolumn has changed, making \kill lines unnecessary, at the price of sometimes requiring a third pass through IATEX.
- The \newpage command now works inside a longtable.

Changes made between versions 3 and 4.

- A new algorithm is used for aligning chunks. As well as the widest width in each column, longtable remembers which chunk produced this maximum. This allows it to check that the maximum is still achieved in later runs. As longtable can now deal with columns shrinking as the file is edited, the \setlongtables system is no longer needed and is disabled.
- An extra benefit of the new algorithm's ability to deal with 'shrinking' columns is that it can give better (narrower) column widths in the case of overlapping \multicolumn entries in different chunks than the previous algorithm produced.
- The 'draft' multicolumn system has been removed, along with related commands such as \LTmulticolumn.
- The disadvantage of the new algorithm is that it can take more passes. The theoretical maximum is approximately twice the length of a 'chain' of columns with overlapping \multicolumn entries, although in practice it usually converges as fast as the old version. (Which always converged in three passes once \setlongtables was activated.)

7 Summary

Table 7: A summary of longtable commands

Parameters

	Parameters		
\LTleft	Glue to the left of the table.	(\fill)	
\LTright	Glue to the right of the table.	(\fill)	
\LTpre	Glue before the table.	(\bigskipamount)	
\LTpost	Glue after the table.	(\bigskipamount)	
\LTcapwidth	The width of a parbox containing the caption. (4in)		
LTchunksize	The number of rows per chunk.	(20)	
Opti	ional arguments to \begin{longtable}	,	
\overline{none}	Position as specified by \LTleft and \LTrigh	t.	
[c]	Centre the table.		
[1]	Place the table flush left.		
[r]	Place the table flush right.		
	Commands to end table rows		
//	Specifies the end of a row		
$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	Ends row, then adds vertical space (as in the ta	bular environment).	
*	The same as \\ but disallows a page break af	ter the row.	
tabularnewline Alternative to \\ for use in the scope of \raggedright and simila			
	commands that redefine \\.		
Row is 'killed', but is used in calculating widths.			
\endhead	Specifies rows to appear at the top of every page.		
\endfirsthead	Specifies rows to appear at the top of the first

	9 The Macros		
	$1 \; \langle *package angle$		
	9.1 Initial code		
	Before declaring the package options, we must define some defaults here.		
\LT@err	The error generating command 2 \def\LT@err{\PackageError{longtable}}		
\LT@warn	The warning generating command 3 \def\LT@warn{\PackageWarning{longtable}}		
\LT@final@warn	If any longtables have not aligned, generate a warning at the end of the run at \AtEndDocument. 4 \def\LT@final@warn{% 5 \AtEndDocument{% 6 \LT@warn{Table \@width s have changed. Rerun LaTeX.\@gobbletwo}}% 7 \global\let\LT@final@warn\relax}		
	9.2 Options		
	The first two options deal with error handling. They are compatible with the options used by the tracefnt package.		
errorshow	Only show errors on the terminal. 'warnings' are just sent to the log file.		
	<pre>8 \DeclareOption{errorshow}{% 9 \def\LT@warn{\PackageInfo{longtable}}}</pre>		
pausing	Make every warning message into an error so TeX stops. May be useful for debugging.		
	<pre>10 \DeclareOption{pausing}{% 11 \def\LT@warn#1{% 12 \LT@err{#1}{This is not really an error}}}</pre>		
set	The next options are just alternative syntax for the \setlongtables declaration.		
final	13 \DeclareOption{set}{} 14 \DeclareOption{final}{}		
	15 \ProcessOptions		
	9.3 User Settable Parameters		
	Glue to the left and right of the table, default \fill (ie centred).		
\LTright	16 \newskip\LTleft \LTleft=\fill 17 \newskip\LTright \LTright=\fill		
_	Glue before and after the longtable. \bigskip by default.		
\LTpost	18 \newskip\LTpre \LTpre=\bigskipamount 19 \newskip\LTpost \LTpost=\bigskipamount		
\LTchunksize	Chunk size (the number of rows taken per \halign). Default 200. 20 \newcount\LTchunksize \LTchunksize=200		
	Page 11		

	longtable.sty
\c@LTchunksize	Added in V3.07 to allow the LATEX syntax \setcounter{LTchunksize}{10}. 21 \let\c@LTchunksize\LTchunksize
\LTcapwidth	Width of the \parbox containing the caption. Default 4in. 22 \newdimen\LTcapwidth \LTcapwidth=4in
	9.4 Internal Parameters
\LT@firsthead \LT@foot	Boxes for the table head and foot. 23 \newbox\LT@head 24 \newbox\LT@firsthead 25 \newbox\LT@foot 26 \newbox\LT@lastfoot
\LT@gbox	27 \newbox\LT@gbox
\LT@cols	Counter for number of columns. 28 \newcount\LT@cols
\LT@rows	Counter for rows up to chunksize. 29 \newcount\LT@rows
\c@LT@tables	Counter for the tables, added in V3.02. Previous versions just used the LATEX counter table, but this fails if table is reset during a document, eg report class resets it every chapter. This was changed from \newcount\LTCtables in V3.04. LATEX counters are preserved correctly when \includeonly is used. In the rest of the file \LTCtables has been replaced by \cClTCtables without further comment. 30 \newcounter{LTCtables}
\c@LT@chunks	We need to count through the chunks of our tables from Version 4 on. 31 \newcounter{LT@chunks}[LT@tables]
\c@table \fnum@table \tablename \ext@table	If the table counter is not defined (eg in letter style), define it. (Added in V3.06.) 32 \ifx\c@table\undefined 33 \newcounter{table} 34 \def\fnum@table{\tablename^\thetable} 35 \fi 36 \ifx\tablename\undefined 37 \def\tablename{Table} 38 \fi 39 \ifx\ext@table\undefined 40 \def\ext@table{lot} 41 \fi
\LT@out	In a normal style, longtable uses the .aux file to record the column widths. With letter.sty, use a separate .lta file. (Added in V3.06.) Not needed for new letter class.
	\ifx\startlabels\undefined

               Since Version 3.02, longtable has used the internal counter \colongetColongtables. The
            LATEX counter table is still incremented so that \caption works correctly.
             62 \def\LT@array[#1]#2{%
               With respect to tagging we have a complicated situation with longtable. When
            at the begin the \endhead, \endfirsthead, \endfoot and \endlastfoot are used
            to setup head and foot they create each a structure subtree with one or more rows.
            From these structures we want to keep at most two (head and foot) and move the
            foot to the end of the table. When the head and foot boxes are (re)inserted on
```

......Page 13.....

```
.....longtable.sty.....
```

following pages we want to mark them up as artifact with the exception of the head at the begin and the foot box at the end.

TODO: When a line is killed the structure subtree is there already too and must be removed. If hard to do, then maybe at first warn if the construction is used.

\LTCarray is executed in a group, so we can disable para-tagging here.

- 63 \UseTaggingSocket{tbl/init}
- 64 \@kernel@refstepcounter{table}\stepcounter{LT@tables}

The target is created rather late and a \label can come earlier, so we have to define \@currentHref explicitly. We can't currently assume that \theHtable is defined always.

- 65 \tl_gset:Ne \@currentHref {table.\cs_if_exist_use:N\theHtable}
- 66 \tbl_gzero_row_count:
- 67 \UseTaggingSocket{tbl/longtable/init}

Set up the glue around the table if an optional argument given.

```
68 \if l#1%
```

- 69 \LTleft\z@ \LTright\fill
- 70 \else\if r#1%
- 71 \LTleft\fill \LTright\z@

\LT@start This macro starts the process of putting the table on the current page. It is not called until either a \\ or \endlongtable command ends a chunk, as we do not know until that point which of the four possible head or foot sections have been specified.

It begins by redefining itself, so that the table is only started once! Until V3.04, was redefined to \relax, now use \endgraf to force the page-breaker to wake up. The second \endgraf is there so that \pagetotal is updated and so takes \LTpre into account.

```
144 (@@=tbl)
145 \ExplSyntaxOn
146 \def\LT@start{%
147 \let\LT@start\endgraf
148 \endgraf\penalty\z@\vskip\LTpre\endgraf
```

This next block was suggested by Lars Hellström in pr tools/3396. He documents it as:

The original problem occurs because TeX has not yet found an awfully bad (b=*) breakpoint and is therefore still collecting material to see if there is a really good break somewhere just ahead. As we know there aren't, we want to make it stop looking and break the page, so that \pagetotal will be for the page where the table will actually end up. To achieve this, we need to give TeX an awfully bad, but legal, breakpoint. The simplest way of doing this seems to be to insert a \kern that counters the \pageshrink for the page, followed by a \penalty and a \par (to exercise the page builder). We also have to make sure that this breakpoint doesn't affect how the next page is broken, so we make the penalty 9999 (10000 is infinite and thus not a legal breakpoint) and cancel out the \kern with a new \kern.

I don't think this is the *right* solution to the problem (that would be that the standard output routine has a feature for syncronizing with typesetting, as part of the preparations for switching output routine), but it's OK. Perhaps XOR will make it better.

```
149 \ifdim \pagetotal<\pagegoal \else
150 \dimen@=\pageshrink
151 \advance \dimen@ 1sp %
152 \kern\dimen@\penalty 9999\endgraf \kern-\dimen@
153 \fi</pre>
```

Start a new page if there is not enough room for the table head, foot, and one extra line.

```
154 \dimen@\pagetotal
```

- $155 \qquad \texttt{\ \ } \\ \texttt{\ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ \ } \\ \texttt{\ \ \ \ \ \ } \\ \texttt{\ \ \ \ \ \ } \\ \texttt{\ \ \ \ \ \ \ } \\ \texttt{\ \ \ \ \ \ \ } \\ \texttt{\ \ \ \ \ \ \ \ } \\ \texttt{\ \ \$
- 156 \advance\dimen@ \dp\ifvoid\LT@firsthead\LT@head\else\LT@firsthead\fi
- 157 \advance\dimen@ \ht\LT@foot

At this point I used to add \ht\@arstrutbox and \dp\@arstrutbox as a measure of a row size. However this can fail spectacularly for p columns which might be much larger. Previous versions could end up with the table starting with a foot, then a page break then a head then a 'first head'! So now measure the first line of the table accurately by \vsplitting it out of the first chunk.

```

9.6 Counting Columns

Columns are counted by examining \@preamble, rather than simply getting \@mkpream to increment the counter as it builds the preamble so that this package works with many of the packages which add extra column specifiers to IATEX's standard ones.

Version 1 counted \@sharp's to calculate the number of columns, this was changed for Version 2 as it does not work with the NFSS. Now count &'s. (lfonts.new (and now the Standard IATEX definition) defines \@tabclassz so that \@sharp is inside a group.)

\LT@nofcols Find the next &, then look ahead to see what is next.

```
227 \def\LT@nofcols#1&{%
228 \futurelet\@let@token\LT@n@fcols}
```

\LT@n@fcols Add one, then stop at an \LT@nofcols or look for the next &. The \expandafter trick was added in Version 3, also the name changed from \@LT@nofcols to preserve the \LT@ naming convention.

```
229 \def\LT@n@fcols{%
230 \advance\LT@cols\@ne
231 \ifx\@let@token\LT@nofcols
232 \expandafter\@gobble
233 \else
234 \expandafter\LT@nofcols
235 \fi}
```

9.7 The \\ and \kill Commands

\LT@tabularcr The internal definition of \\. In the * form, insert a \nobreak after the next \cr (or \crcr).

This star form processing was finally added in v4.05. For the previous six or seven years the comment at this point said

This definition also accepts *, which acts in the same way as \\. tabular does this, but longtable probably ought to make * prevent page breaking.

{\ifnum0='}\fi added in version 3.01, required if the first entry is empty. The above in fact is not good enough, as with array package it can introduce a {} group in math mode, which changes the spacing. So use the following variant. Added in v3.14.

```
236 \protected\def\LT@tabularcr{%
237 \relax\iffalse{\fi\ifnum0='}\fi
238 \@ifstar

TODO: as we replace crcr later in one case, we probably have to implement some further logic there!

     \LT@get@widths
     \LT@bchunk}
```

\LT@echunk This ends the current chunk, and removes the dummy row.

```
281 \def\LT@echunk{%
     \crcr\LT@save@row\cr\egroup
282
     \global\setbox\LT@gbox\lastbox
```

The following line was added in v4.05. longtable relies on \lineskip glue (which is 0pt) to provide break points between each row so the table may be split into

Previous releases left the \lineskip glue at the end of each chunk that had been added when the dummy row was added. There was no glue at the start of the next chunk as TFX normally does not put \lineskip glue at the top of a box. This meant that normally the chunks fitted together perfectly, however \noalign material at a chunk boundary came before the first row of the next chunk but after the lineskip glue at the end of this chunk. This is the wrong place, e.g., it means even a \penalty10000 does not stop a break as the \lineskip glue in the previous item on the list provides a legal breakpoint. So now remove the \lineskip glue that was before the dummy row and introduce \LT@setprevdepth to set the \prevdepth at the start of the next chunk, to make sure \lineskip glue is added later.

```
284
        \unskip
285
      \egroup}
```

\LT@entry We here give the 'basic' definition of \LT@entry, namely that used in alignment templates. It has a \kern only if the maximum is imposed from a different chunk. The \ifhmode test reveals the first entry, when we don't want to add an &.

```
286 \def\LT@entry#1#2{%
287
     \ifhmode\@firstofone{&}\fi\omit
     \ifnum#1=\c@LT@chunks
288
     \else
289
        \kern#2\relax
290
     \fi}
291
```

\LT@entry@chop This definition for the argument of \LT@save@row is used to scrap all those maxima which could not be verified because they occur after the end of the table. This can happen only if a table has been shortened (or the sequencing got mixed up) since the previous run. Note that this is premature: the last chunk still is going to be set, and with the chopped limits.

```
292 \def\LT@entry@chop#1#2{%
     \noexpand\LT@entry
293
        {\ifnum#1>\c@LT@chunks
294
           1}{0pt%
295
         \else
296
           #1}{#2%
297
        fi}
298
```

```
.....longtable.sty.....
\LT@entry@write To write an entry for the aux file, we use a slightly surprising definition which has
                the sole purpose of avoiding overfull lines (which might break TEX's limits when
                reading the aux file, probably you'd need to have a few hundred columns before
                this happened but...).
                299 \def\LT@entry@write{%
                     \noexpand\LT@entry^^J%
                     \@spaces}
       \LT@kill This ends the current chunk as above, but strips off two rows, the 'dummy row'
                and the 'killed row' before starting the next chunk. Since V3.04, the old chunk is
                reboxed at the start of the box containing the next chunk. This allows \kill to
                be used in headers, which must be processed in a single box.
                302 \def\LT@kill{%
                     \LT@echunk
                     \LT@get@widths

                     \expandafter\LT@rebox\LT@bchunk}
      \LT@rebox Drop the old chunk (box0) back at the top of the new chunk, removing the killed
                row. This macro added at V3.04.
                306 \def\LT@rebox#1\bgroup{%
                     #1\bgroup
                307
                     \unvbox\z@
                308
                     \unskip
                309
                     \setbox\z@\lastbox}
                      The Dummy Row
                9.8
                The dummy row is kept inside of the macro \LT@save@row.
 \LT@blank@row Create a blank row if we are not using the info in the .aux file.
\LT@build@blank _{311} \def\LT@blank@row{%}
                     \xdef\LT@save@row{\expandafter\LT@build@blank
                       \romannumeral\number\LT@cols 001 }}
                Whoops! What's that supposed to be? A drop-in replacement for the first task of
                Appendix D in the TEXbook. The \romannumeral produces \LT@cols instances
                of m followed by i. The below macro then replaces the ms by appropriate entries.
                314 \def\LT@build@blank#1{%
                315
                     \if#1m%
                       \noexpand\LT@entry{1}{0pt}%
                316
                       \expandafter\LT@build@blank
                317
                318
                     \fi}
   \LT@make@row Prior to version 4, by default did not use information in the .aux file but now we
                can define \LT@make@row to use the .aux file, even on the 'draft' passes.
                319 \def\LT@make@row{%
                     \global\expandafter\let\expandafter\LT@save@row
                320
                       \csname LT@\romannumeral\c@LT@tables\endcsname
                321
                     \ifx\LT@save@row\relax
                322
                       \I.T@blank@row
                323
```

```
.....longtable.sty.....
```

Now a slightly difficult part comes. Before we decide making the template from the .aux file info we check that the number of fields has remained the same. If it hasn't, either the table format has changed, or we have the wrong table altogether. In both cases, we decide to better drop all gathered information and start over.

The expansion between !...! below will be empty if the number of \LT@entry macros including arguments in \LT@save@row is equal to \LT@cols. If it is not empty, we throw the row away and start from scratch.

```
325
       {\let\LT@entry\or
326
        \if!%
            \ifcase\expandafter\expandafter\LT@cols
327
            \expandafter\@gobble\LT@save@row
328
329
            \or
            \else
330
331
              \relax
332
            \fi
333
           !%
334
        \else
          \aftergroup\LT@blank@row
335
336
337
     \fi}
```

\setlongtables Redefine \LT@make@row to use information in the .aux file, if there is a saved row for this table with the right number of columns.

> Since Version 3.02, longtable has used the internal counter \colongtables rather than the IATEX counter table. The warning message was added at V3.04, as was the \global, to stop save-stack overflow.

> Since Version 4.01 \setlongtables does nothing as it is not needed, but is defined as \relax for the benefit of old documents.

```
338 \let\setlongtables\relax
```

\LT@get@widths This is the heart of longtable. If it were not for the table head and foot, this macro together with the modified \\ command would form the basis of quite a simple little package file for long tables. It is closely modelled on the \endvrulealign macro of appendix D of the T_FXbook.

```
339 \def\LT@get@widths{%
```

\global added at V3.04, to stop save-stack overflow.

Loop through the last row, discarding glue, and saving box widths. At V3.04 changed the scratch box to 2, as the new \kill requires that \box0 be preserved.

```
340
     \setbox\tw@\hbox{%
341
       \unhbox\LT@gbox
       \let\LT@old@row\LT@save@row
342
       \global\let\LT@save@row\@empty
343
       \count@\LT@cols
344
       \loop
345
          \unskip
346
347
          \setbox\tw@\lastbox
348
        \ifhbox\tw@
          \LT@def@row
          \advance\count@\m@ne
350
351
        \repeat}%
```

```
.....longtable.sty.....
            Remember the widths if we are in the first chunk.
                  \ifx\LT@@save@row\@undefined
            353
                    \let\LT@@save@row\LT@save@row
            354
\LT@def@row Add a column to the dummy row. Name changed from \defLT@save@row in
            Version 3, to preserve the \LTC naming convention.
            355 \def\LT@def@row{%
            We start by picking the respective entry from our old row. These redefinitions of
            \LT@entry are local to the group started in \LT@get@widths.
            356
                  \let\LT@entry\or
            357
                  \edef\@tempa{%
            358
                    \ifcase\expandafter\count@\LT@old@row
            359
                    \else
            360
                      {1}{0pt}%
            361
                    \fi}%
            Now we tack the right combination in front of \LT@save@row:
                  \let\LT@entry\relax
            362
                  \xdef\LT@save@row{%
            363
                    \LT@entry
            364
                    \expandafter\LT@max@sel\@tempa
            365
                    \LT@save@row}}
            366
\LT@max@sel And this is how to select the right combination. Note that we take the old max-
            imum information only if the size does not change in either direction. If the size
            has grown, we of course have a new maximum. If the size has shrunk, the old max-
            imum (which was explicitly not enforced because of being in the current chunk)
            is invalid, and we start with this chunk as the new size. Note that even in the
            case of equality we must use the \theta \ construct instead of #2 because #2
            might be read in from the file, and so could have \catcode 11 versions of p and t
            in it which we want to be replaced by their 'proper' \catcode 12 versions.
            367 \def\LT@max@sel#1#2{%
                  { = wd tw0}
            368

             464 \def\LT@end@hd@ft#1{%
                This command is used to store the head and foot boxes. We need to retrieve
             and store the row so that we can clean up the structure in the finalize code.
                To handle missing columns in the header we need this:
                  \tbl_if_row_was_started:TF
             465
                     {
             466
             TODO: This is exposing internal counters, so it should be encapsulated in some
             interface command (but I'm not sure what that should be called, so not done yet.
                       \tbl_count_missing_cells:n {head/foot}
             467
                       \int_step_inline:nn
             468
                         { \LT@rows + 1 }
             469
             470
                         {
             471
                           \seq_gput_left:ce
```

```
.....longtable.sty.....
                {g_@@_\cs_to_str:N #1 _rows_seq }
472
                { \left\{ \right. } \left( -\frac{1}{2} \right) = \left\{ -\frac{1}{2} \right\} 
473
474
We also have to set the chunk rows to its max value before calling \LTechunk so
that we don't get extra increments of the main row counter due to \everycr.
          \int_gset:Nn \LT@rows { \LTchunksize }
        }
476
   If we are still in column zero then we had an empty \endhead and so making
any assignment, etc., would start a row — something we don't want. To get out of
this trap we run \crcr (which would normally come inside \LT@echunk. That will
then trigger \everycr and update row counter unnecessarily, but now we have a
defined state, so we can use \noalign to undo that. We also change \LT@rows so
that further \crs do not do any harm (as explained above.
   The \crcr inside \LT@echunk will be bypassed in that case as we have just
executed a \crcr and are still in scanning modus for \omit or \noalign.
477
          \crcr
478
479
          \noalign{
            \tbl_gdecr_row_count:
                                           % undo the increment
480
            \int_gset:Nn \LT@rows { \LTchunksize }
481
482
        }
483
     \LT@echunk
484

9.13 The \multicolumn command

Earlier versions needed a special 'draft' form of \multicolumn. This is not needed in version 4, and so these commands have been removed.

\LTmulticolumn

\LT@mcwarn

1	
longtable.st	5V

9.14 Footnotes

The standard \footnote command works in a c column, but we need to modify the definition in a p column to overcome the extra level of boxing. These macros are based on the array package, but should be OK for the standard tabular.

\LT@startpbox Add extra code to switch the definition of \@footnotetext.

```
500 \def\LT@startpbox#1{%
501
     \bgroup
       \color@begingroup
502
       \let\@footnotetext\LT@p@ftntext
503
       \setlength\hsize{#1}%
504
       \@arrayparboxrestore
505
       \everypar{%
506
507
         \vrule \@height \ht\@arstrutbox \@width \z@
508
          \everypar{}}%
509
```

\LTQendpbox After the parbox is closed, expand \LTQpQftn which will execute a series of \footnotetext[$\langle num \rangle$] { $\langle note \rangle$ }

commands. After being lifted out of the parbox, they can migrate on their own from here.

```
510 \def\LT@endpbox{%
511 \definalstrut\@arstrutbox
512 \color@endgroup
513 \egroup
514 \the\LT@p@ftn
515 \global\LT@p@ftn{}%
516 \hfil}
```

\LT@p@ftntext Inside the 'p' column, just save up the footnote text in a token register.

```
517 \long\def\LT@p@ftntext#1{%
```

Some variables need for the tagging support.

```
520 \( \emptyce{QQ=tbl} \)
